PROTEIN FRACTIONATOR

Operation Manual

RK2 RK300 PE Protein Fractionator

- I. Introduction
- II. Tools, parts and hardware
- III. Unpacking procedures
- IV. Assembly procedures
- Appendix A: Components (includes hardware packages)
- Appendix B: Views of fully assembled RK2RK300 PE (separate documents)

I. Introduction

Congratulations on your purchase of the RK300 PE Protein Fractionator. The RK300 PE processes 300 gallons per minute with a two-minute dwell time, and 380 GPM with a 1.5-minute dwell time. One unit adequately serves aquaria from 18,000 to 22,800 gallons. When assembled, operated and maintained correctly, your RK300 PE will provide many years of service, clean water, and health for aquatic life systems.

Should any technical issues arise during assembly or operation of this unit, please contact your RK2 Systems Distributor.

Follow the instructions below very carefully, taking special note of the Helpful

Hints , Notes  and Warnings . This will help prevent breakage of any difficult-to-replace components. Appendices A and B, at the end of this document, identify the fixtures and assemblies you will be installing.

HINT: It requires at least two people to assemble the RK2RK300 PE, as well as at least one step ladder.

II. Tools, Parts and Hardware

Tools needed:

- Flat-head screwdriver
- Two 3/4" open-end wrenches
- One 1 1/8" socket wrench
- One 3/4" socket wrench
- Two 1/2" box-end wrenches
- Box-cutter or similar blade
- One tube of Dow Corning Compound 111 Silicone or similar Teflon Grease product, available at swimming pool or industrial plastics supply *

- * For the silicone or Teflon grease, any of the products pictured at left will suffice.

WARNING: Do not use pipe wrenches for assembly of the filter. Doing so will result in expensive damage to the unit.

Hardware is included in various bags, pictured in Appendix A.

III. Unpacking Procedures

- A. The RK300 PE comes shipped in two boxes (Fig. A). The largest of the two boxes contains the Reaction Chamber and most of the components, stored inside the Chamber.

Fig. A

HINT: An easy way to uncover the Reaction Chamber is to use a box cutter or similar knife to slice a line around the perimeter of the box, and lift the top off the bottom section that remains stapled to the pallet, as shown in Fig. B. Remove the box, and remove the bubble wrap surrounding the Top/Cone.

Fig. B

- B. To remove the components stored within the Reaction Chamber, one person should climb inside and pass them out to the other person assisting in assembly.

Each filter is pre-assembled at the factory, and then dismantled for shipping. The components packaged with each filter are specific to that unit. When installing several units, it is important not to mix the components, but rather to keep each unit's components separate, even if they appear identical.

- C. Remove the plastic wrap surrounding the Reaction Chamber. Using a 1/2" wrench, remove the 2" bolts securing the Reaction Chamber to the pallet, and set the pallet aside.

Fig. C

- D. Matching the components to descriptions in this manual (See Appendix A), set aside all parts where they can be identified and retrieved conveniently.
- E. Prior to attaching pipes, remove any tape from threading. (This tape is used to keep washers and O-rings from falling off.)

- F. After removing the smaller box (Top/Cone Assembly), remove the protective bubble wrap and separate the components, as shown in Figs. F1 and F2.

Fig. F1

Fig. F2

- G. Using a screwdriver, remove the round inserts from the pipe clicks throughout the RK300 PE's Reaction Chamber.

Fig. G

IV. Assembly Procedures

As mentioned before, it is important to have two people involved in the assembly of the RK300 PE.

Assembling the unit also requires the assembler to tighten bolts on several flanges. The torque values for these flanges is lighter than what would be expected for similar flanges, and we recommend using a torque wrench, utilizing the torque table found in Appendix C.

Mounting the Top/Cone Assembly

1. Remove the bolts that hold the Top/Cone Assembly together. (Fig. 1)

Fig. 1

2. Separate the clear Top and Cone, gaskets, etc. (Fig. 2A). Note the three-piece gasket as shown in Fig. 2B.

Fig. 2A

Fig. 2B

HINT: Remembering to apply a ring of silicon grease (as shown above) inside the ring of bolt holes between all layers, you can continue to assemble the Gaskets, Cone and Top Assembly using the diagram shown below, and skip to Step 10. (Diagram not to scale.)

3. Apply a line of grease around the entire perimeter of the Reaction Chamber along the inside of the bolt holes, as shown in Fig. 3.

Fig. 3

HINTS: Do not get this grease on your clothes! It does not dry, which is one of the reasons it's perfect for this job. A small amount of grease goes a long way. As long as you've got the grease on your finger, you can also apply it to the Waste Drain port as shown in Fig. 11 and the Discharge Gasket shown in Fig. 13. However, if you do that you'll be skipping around so be sure to return back to Step 5, below, after you're finished greasing!

4. Place the interlocking 3-piece gasket along the top of the Reaction Chamber and align with the bolt holes (See Fig. 4)

Fig. 4

5. Apply a bead of grease along the inside holes of the 3-piece gasket, similar to step 3, above.

Fig. 5

6. Place the cone on top of the 3-piece gasket, as shown in Fig. 6.

7. Apply another line of grease along inside perimeter of cone, as shown in Fig. 7.

Fig. 6

Fig. 7

8. Fit the second three-piece gasket on top of the cone, as shown in Fig. 8.
9. Apply a bead of grease along the inside holes of the 3-piece gasket, similar to previous steps noted above. (Fig. 9)

Fig. 8

Fig. 9

10. Insert the Internal Drop-Down Wash Assembly into the hole in the center of the Top. (Step not shown). Mount the Top (Fig. 10A) and align with the black notch which is directly above the pipe hanger bracket (10B).

Fig. 10A

Fig. 10B

11. Use a screwdriver or similar object to line up the holes found along the outside ring of the Top/Cone Assembly with the holes in the gasket and Reaction Chamber, as shown in Fig. 11.

Fig. 11

12. Using a 1/2" wrench, bolt the top assembly to the top of the Reaction Chamber and various components you have just installed (Fig. 12A). When tightening the bolts, take care to tighten them in opposing perpendicular pairs, similar to the diagram shown in Fig. 12B.

Fig. 12A

Fig. 12B

The Top is very fragile. DO NOT tighten the bolts in a circle around the Reaction Chamber, or you risk fracturing the acrylic top. When tightening the bolts, follow a pattern of tightening opposite sides of the bolts in sequence, as shown in Fig 12B, above.

13. Using box-end wrenches, tighten the bolts until snug. The PSI of the water running through this part of the RK300 PE is LOW. Because of that, and because of all the grease you have applied, you do not need to tighten the bolts beyond snug. See Fig. 13 as an indication of what "snug" looks like in this case.

Fig. 13

Mounting the Discharge Flange

14. The pipe-hanging bracket is used to secure the Discharge Plumbing to the Reaction Chamber. Part of it is attached to the Discharge Plumbing Assembly for ease of packing, and the other half is attached to the body as shown in Fig. 10B.

Take the attached section and turn it horizontally, as shown in Fig. 14.

Fig. 14

15. Remove the remaining parts of the pipe-hanging bracket from the Discharge Plumbing Assembly. They are shown detached in Fig. 15.

Fig. 15

- 16 Apply a bead of silicon grease to both sides the Discharge Gasket, positioning it within the inner perimeter of the holes, as shown in Fig. 5. Spread evenly over **both sides** of the gasket.
17. Attach the Discharge Plumbing Flange to the Reaction Chamber, including the gasket included with the eight bolts. It is helpful to have one person hold the flange in the upright position while the other tightens the bolts in a pattern similar to Fig. 10B.

Fig. 17

18. Take the detached portion of the pipe-hanging bracket and join it to the attached portion (Fig. 18A) Insert the threaded section through and attach the bolts, holding the Discharge Plumbing flange securely in place (Fig. 18B).

Fig 18A

Fig 18B

19. Attach the sight gauge as shown in Fig. 19.

Fig. 19

20. Thread the Air Vent onto the top of the Discharge Plumbing, as shown in Fig. 20.

Fig. 20

21. Attach the Freshwater Rinse Assembly. The controller mounts onto the bracket found on the Air Vent, while the bottom valve mounts to a pipe click and the top mounts to a junction found coming out the side of the Top/Cone Assembly.

Fig. 21A

Fig. 21B

Mounting the Pump, Venturi Plumbing, and Related Components

22. Place the Pump Platform at the base of the Reaction Chamber as shown in Fig. 22.

Fig. 22

23. Set the Pump Base on top of the Pump Platform as shown in Fig. 23. The weight of the pump will "iron out" any curvature.

Fig. 23

24. Set the pump on top of the Pump Base, and attach it to the junction as shown in Fig. 24. When tightening the junction, make sure the surfaces are positioned flush to each other (Fig. 24, inset).

Fig. 24

25. Attach the Venturi Assembly to the ball valve union and pipe clicks (Fig. 25A) and to the pump (Fig. 25B).

Fig. 25A

Fig. 25B

26. Attach the Venturi Air Intake Plumbing to the pipe clicks and to the Venturi Plumbing Assembly (See Fig. 26).

Fig. 26

27. Attach the Air Gauge to the open end of the Venturi Air Intake Plumbing. Note that this union is not threaded and is designed to be removed periodically for maintenance. (See Fig. 26.)

Do not glue the air gauge to the Venturi Air Intake Plumbing. Gluing it will make it impossible to detach and clean the gauge.

Fig. 27

28. Attach the Saltwater Rinse Assembly to the top of the Venturi Plumbing Assembly (Fig. 28A) and the Top Union (Fig. 28B), fastening the Timer to the bracket found on the Venturi Plumbing Assembly.

Fig. 28A

Fig. 28B

Fig. 28C

Installing the Waste Drain

29. Using Silicone Grease, lubricate the port found at the rear of the Top/Cone Assembly (Fig. 29A), and insert the Waste Drain (Fig. 29B).

Fig. 29A

Fig. 29B

Congratulations! You have successfully assembled the RK300 PE! Now it's time to plumb it to the outside world. See Fig. 29C for completed unit.

Fig. 29C

30. Plumb the dirty water to the Ball Valve Intake.
31. Plumb the Waste Drain to the sewage line.
32. Plum the Discharge to reservoir.

WARNING: Immediately after the 6" Discharge, you must provide a minimum of 12" vertical drop. Do not install horizontal piping until you have provided 12" of vertical drop.

33. After you have completely connected the RK300 PE, fire it up! Then inspect for any unions or nuts/bolts that leak, and hand tighten.

Appendix A: Components

Included within the Reaction Chamber (main structural component of the RKRK300 PE) and accompanying boxes there are some components wrapped in bubble-wrap that you will need to ins. They are shown below for your reference (not to scale):

Internal Drop-Down Wash Assembly

Air Gauge

3-Piece Washer (2 sets included)

Freshwater Rinse Assembly

Saltwater Rinse Assembly

PROGRAMMING YOUR LCD WASHDOWN TIMER:

Follow Steps 8-14 to program you LCD Washdown timer for use with your RK2 Skimmer.

Under Step 12 – you will want to use the Cyclical Irrigation.

Step 13 – does not pertain to our use.

Following the shortened version of the manual with the pertinent information for use with your RK2 Skimmer is the full & complete manual for the LCD Washdown timer for your reference.

DIG controllers are programmed with the aid of four buttons:

- ⌚ Use to select the desired programming mode
- ⊖ Use to lower the value of the selected parameter (e.g. deducts an hour)
- ⊕ Use to raise the value of the selected parameter (e.g. adds an hour)
- ➡ Use to select the parameter to be changed (hour, minute, etc.). To implement the changes, the selected parameter must be flashing.

If no changes are implemented, the controller will always revert to the main screen.

8. PROGRAMMING

This section explains the programming features, use of buttons and the steps necessary to assign irrigation schedules. To program the controller use the left button to select the desired programming mode, the right button to make the entry flash and the plus minus buttons to change the value.

Note: Only a flashing character can be changed.

9. PROGRAMMING CURRENT TIME AND DAY OF THE WEEK

To enable the controller to operate properly, the current time and current day of the week must first be set. Steps below explain how to set the day and time.

Press the ⌚ hour digit will blink. Use the ⊕ or ⊖, to set the current hour (note: use of AM and PM designations). Press ➡ the minutes digit blink, set the current minute using ⊕ or ⊖. Press ➡ A blinking arrow will appear under "M" for "Monday". Use the ⊕ or ⊖ to move the arrow to current day. Press ⌚ to proceed to the next step.

Note: If the last data entered stops flashing, press the ⌚ again to resume programming.

10. TIME FORMAT (SWITCHING BETWEEN AM/PM AND 24 HOUR)

The default time format is AM/PM. There is also a 24 hour time format option that can be switched between the two formats.

Press ⌚ several times until ⌚ appears.

Press ➡ hour digit will blink. Press the ⊕ or ⊖ simultaneously. The clock reading switches from AM/PM to a 24 hour time display or vice versa.

Note: You can switch the time display format at any step in this section of the programming process.

11. SETTING WATERING TIME (DURATION)

This setting determines the length of time that the valve will remain open.

Press until appears. Press , the hour/minute digits blink. Set the desired number of hours by pressing or . Press again, the minute digits blink. Set the desired number of minutes by pressing or . Repeat the same steps for seconds. Press to proceed to the next step.

12. PROGRAMMING WATERING SCHEDULE

This setting determines which days the controller will operate. Choose either "A. Watering According to the Days of the Week" or "B. One-time Irrigation or Cyclical Irrigation".

Press until appears. Press . A blinking arrow appears at the top of the display, under Monday. At this stage you can set one of two options:

- Watering according to the days of the week,
- One time only watering, cyclical watering in minutes, hours or days.

CYCLICAL IRRIGATION

This option is used to program the controller to operate the system in a cyclical manner. Once every 1 minute up to 5 minutes, every 5 minutes up to 15 minutes, every 15 minutes up to 1 hour, every 1 hour up to 24 hours, and every day up to 30 days.

Press until appears. Press several times (to advance all the days of the week) until appears, and blinks on the display. With the display blinking, press or . The number of minutes, hours or days between watering cycles appears on the display. For

example if "every 15 minutes" is selected, your programmed watering duration will activate every 15 minutes during a 24-hour period. (see #19 for irrigation window). For example, if "every 30 days" appears, watering will take place once every thirty days, for the irrigation period as set in duration. To change the number of days press or . Press to proceed to the next step.

12

14. SETTING A CYCLICAL OR ONCE START TIME (WITH OPTION TO DELAY VALVE START TIME)

This program is used to pre-set the valve start time (only one start time available) and the number of days to delay the valve start time, the number of day(s) to delay option will appear on the display to the right of the irrigation start time above the word "days".

In this feature 0 days = program starts today; where 1 = program starts tomorrow, etc. (up to 30 days delay).

Press until START 1 appears or the last opening time entered appears on the display.

Press . The hours and the AM/PM digits

blink. Set the desired opening hour by pressing the or (note: AM and PM designations appear to the left of the hour digits). Press . The minute digits blink. Repeat the same step for setting the minutes and then the number of days to delay between watering cycles. Start time must be later than the current time in order for the cycle to start today (day = 0).

RK2

SYSTEMS

Owners Manual

Professional Quality
Corrosion Resistant
Energy-Efficient

Centrifugal Pumps

RK2 Pumps are end suction centrifugal units that are close coupled to 56J motors. They feature excellent corrosion resistance with molded Noryl pump housings, 316 ss hardware, pump seals of Monel ceramic and buna, and motors with PVC encapsulated stainless steel motor shafts. Numerous electrical motor configurations are available.

WARNING: PLEASE READ COMPLETELY BEFORE YOU INSTALL OR OPERATE YOUR NEW PUMP! NEVER RUN PUMP DRY! NEVER REVERSE ROTATION! NEVER EXCEED AN INTERNAL CASE PRESSURE OF: 100 PSI MAX NORYL

Thank you for choosing an RK2 System pump. It has been designed and built to provide you with years of dependable service. To insure maximum performance, we urge you to carefully follow the instructions in this manual. If you have any questions, call your nearest distributor or (760) 746-7400 for assistance.

Installation

Proper installation of your pump will help it to provide you with dependable, trouble free service. Please follow the general guidelines listed below to help insure maximum performance.

1. Position the pump as near the water intake source and as low as is practical. This will help avoid cavitation and maximize your pumps output.
 2. Protect the motor from excessive heat and moisture. It is best to provide shade from direct sun, and insure that it has proper ventilation. Excessive heat will shorten the motor life and void the warranty.
 3. Protect the motor against dirt, water and all foreign matter. If the motor has been flooded, shut off power and do not operate it until it has been checked by an authorized motor technician, and it has been certified safe to operate. If the motor is damaged by dirt or moisture it voids the warranty.
 4. Mount the motor where it cannot become submerged.
 5. The fittings used to connect to the housing should be plastic. All plumbing lines should be self supported and properly aligned. This will prevent undue stress to the housing.
 6. The intake to the pump should never be restricted. Keep your suction lines as free of elbows, fittings and valves as possible. **The use of large diameter pipe will help provide adequate flow**, as it reduces friction loss.
 7. This is a non self priming pump and is best suited with a flooded suction. The pump housing, and the entire suction line must be filled with fluid for it to operate properly. **Do not run dry!**
-

Electrical

1. Make sure the power is disconnected at the breaker before wiring the motor.
2. Make sure that the motor is wired so that it matches the supply voltage (115, 208, 230 or 460 volt). If they do not match it will damage your motor and void the warranty.
3. **Use a wire of adequate gauge** and length to prevent electrical line losses. The use of heavier gauge wire will allow the motor to run cooler and more efficiently.
4. Make sure all connections are clean and tight. Properly ground the motor. (There is normally a green ground terminal located on the inside of the motor connection box.) Make sure the ground wire is properly connected to an electrical service ground. Connect the pump permanently to an adequately sized circuit. It is best to have a dedicated circuit that won't suffer voltage drop from other loads.

THREE PHASE MOTORS: 1 1 1

5. Insure proper motor *rotation*. When viewed from the shaft end, the motor must rotate counterclockwise. Incorrect rotation will destroy the pump and motor.
Note: The motor leads must be energized in the correct order. If you are not sure of the sequence of your incoming supply line, **remove the volute from the pump**, connect the power and check rotation. When the rotation is correct, reinstall the volute. Do not test with volute in place! **Never test rotation by bumping a switch!!! This will destroy the pump and void the warranty!!!!** If it is incorrect, exchange any two of the connected leads and retest.

Disassembly

1. Shut off the power to the motor before disconnecting any electrical wiring from the back of the motor.
2. Disassemble the volute from the bracket motor assembly by removing the seven $\frac{1}{4}$ 20 x 2 $\frac{3}{4}$ cap screws. (The volute may be left in-line if you wish.)
3. Remove the cap covering the back end of the motor shaft and with a large screwdriver or wrench, prevent shaft rotation while unscrewing the impeller counterclockwise.
4. Remove the ceramic piece from the impeller hub.
5. Detach the bracket from the motor by removing the four $\frac{3}{8}$ " cap screws, and slide it forward, away from the motor.
6. Remove the carbon-graphite seal from the bracket by pressing it out from the back. Do not dig it out from the front!

Pump End Assembly

1. Check all pump parts and clean as needed.
2. If the motor shaft has corrosion build up, use emery cloth to clean it.
3. Install the O-ring into the O-ring gland in the bracket bore.
4. Press the carbon seal head into the bracket bore. **CAUTION! Press only on the stainless steel or polypropylene shell, NOT ON THE DELICATE CARBON FACE! DO NOT TOUCH THE CARBON SEAL FACE!**
5. Note: It is not recommended to use a slinger in conjunction with a PVC shaft sleeve.
6. Mount the bracket onto the motor C-face using four $\frac{3}{8}$ " cap screws and tighten them snugly.
7. Press the ceramic into the impeller hub. It helps to moisten the rubber boot with water first. The ceramic **MUST SIT FLAT**. If one side is higher than the other, the seal will leak! The smooth face must be up and exposed.
8. Screw the impeller clockwise onto the motor shaft and tighten. You can hold the shaft stationary at the opposite end of the motor with a large screwdriver or wrench..
9. Place the large O-ring in the groove in the volute. Note: It is easiest to lay the volute, suction side down, place the O-ring in the groove, and lower the bracket/motor assembly down onto the volute. (So the O-ring doesn't pop out.)
10. Install the seven $\frac{1}{4}$ " x 2 $\frac{3}{4}$ " socket cap screws with washers and tighten in a cross pattern until they are reasonably snug. (No need to overtighten).
11. Place the small O-rings onto both drain plugs, and screw them into the $\frac{1}{4}$ " holes in the volute and bracket.

Trouble Shooting Aid

Motor Will Not Start

1. Check for voltage present at connection box.
2. Check that the supply voltage matches the motor voltage connections.
3. Check that you have proper line voltage.
4. Check that all connections are sound.
5. Check that the motor shaft rotates easily by hand. (This can be checked at the rear of motor by turning with screwdriver or wrench.)

Motor Won't Start, But It Hums.

1. Check items 2-5 above.
2. Check that there is no foreign matter lodged between the contacts on the start switch.
3. Check to insure the capacitor is functioning properly.

Motor Gets Hot And Shuts Down.

1. Check for proper wiring in the motor box. The supply voltage must match the motor voltage connections.
2. Check the voltage at the motor box, with the motor and all other loads normally on the circuit running. It must not be significantly below the nominal voltage.
3. Check to see if the motor shaft turns without excessive resistance. Bad bearings, or a clogged impeller can cause excessive resistance.
4. Make sure any check valves are installed in the correct direction.
5. Check that the pump impeller and the housing are not clogged or blocked.

Pump Will Not Hold A Prime.

1. Check for defective joints at all pipe fittings. They must be air tight.
2. Check for a defective check valve or foot valve.
3. Check for a leaking seal.

RK2 PROTEIN FRACTIONATOR FLOW CONTROL SETTINGS

INITIAL START-UP

1.) WITH THE VENTURI PUMP(S) OFF, OPEN ALL WATER VALVES FULLY EXCLUDING INLET SUPPLY. OPEN THE FRACTIONATOR INLET VALVES, THE VALVES SHOULD BE ADJUSTED TO ALLOW A MAXIMUM FLOW RATE AT WHICH THE FILTER IS RATED.

CHECK FOR LEAKS. IF ANY UNIONS HAVE LEAKS HAND -TIGHTEN ONLY. IF THE UNION CONTINUES TO LEAK THE FITTING NEEDS TO EXAMINED FOR CRACKS AND CORRECT "O" RING SEATING.

LEAKS AT THE FLANGE AREA SHOULD BE ADDRESSED BY TIGHTENING THE FLANGE BOLTS IN A CRISS-CROSS PATTERN. THE SCH80 FLANGES WITH INSERTS IN THE TANK WALL SHOULD TORQUED TO A MAXIMUM OF 25LBS. THE FLANGE CONNECTING THE CLEAR CHAMBER TO THE TANK SHOULD TIGHTENED IN A CRISS-CROSS PATTERN ½ TURN PAST HAND TIGHT. INCORRECT TIGHTENING OF THIS FLANGE WILL FRACTURE THE UPPER CHAMBER.

2.) TURN ON THE VENTURI PUMP(S). ADJUST THE AIR/OZONE FLOW INTO THE FRACTIONATOR WITH THE NEEDLE CONTROL VALVE . DIFFERENT MODEL VENTURIS HAVE DIFFERENT FLOW RATES. CHECK THE GAUGE WITH THE NEEDLE VALVE SET TO FULL FLOW. THE TOTAL FLOW SHOULD THEN BE REDUCED BY 20%. THIS FLOW REDUCTION WILL CREATE A VACUUM OF 1" TO 2" IN THE VENTURI GAS INTAKE LINE. THIS IS THE CORRECT SETTING. IF OZONE IS APPLIED, THE AIR FLOW SHOULD BE REDUCED BY THE AMOUNT OF OZONE BEING INTRODUCED SO THAT THE TOTAL COMBINED FLOW REMAINS THE SAME.

3.) FINAL FOAM LEVEL ADJUSTMENT IS CONTROLLED WITH THE FILTER DISCHARGE VALVE. ALL OTHER VALVES SHOULD REMAIN IN THERE SET POSITIONS AND THE DISCHARGE VALVE ADJUSTED AS NECESSARY FOR CHANGING CONDITIONS AND TO ACHIEVE THE CORRECT FOAM CONSISTENCY.
(SEE "PROPER PROTEIN ADJUSTMENT")

Series RM Rate-Master® Flowmeters

Specifications - Installation and Operating Instructions

Fig. 1

Fig. 2

Dwyer Series RM Rate-Master® Flowmeters are furnished in three models (see Fig. 2), each available in a broad array of flow ranges with direct reading scales for air, gas or water. Installation, operation and maintenance are very simple. Only a few common-sense precautions must be observed to assure long, trouble-free service.

CAUTION: Dwyer Rate-Master® Flowmeters are designed to provide satisfactory long-term service when used with air, water or other compatible media. Refer to factory for information on questionable gases or liquids. Avoid solutions of acids, bases or salts having a pH below 5.0 or above 8.5. Caustic solutions, antifreeze (ethylene glycol) and aromatic solvents should definitely not be used.

Calibration

Each Rate-Master® Flowmeter is calibrated at the factory. If at any time during the meter's life, you wish to re-check its calibration, do so only with devices of certified accuracy. DO NOT attempt to check a Rate-Master® Flowmeter with a similar flowmeter, as seemingly unimportant variations in piping and back pressure may cause noticeable differences in the indicated reading. If in doubt, return your Dwyer Rate-Master® Flowmeter to the factory. Its calibration will be checked for you at no charge. Before proceeding with installation, check to be sure you have the Rate-Master model and flow range you require.

LOCATION: Temperature, Pressure, Atmosphere and Vibration:

Dwyer Rate-Master® Flowmeters are exceptionally tough and strong. They are designed for use at pressures up to 100 psi (6.89 bar) and temperatures up to 130°F (54°C).

DO NOT EXCEED THESE LIMITS! The installation should not be exposed to strong chlorine atmospheres or solvents such as benzene, acetone, carbon tetrachloride, etc. The mounting panel should be free of excessive vibration, as it may prevent the unit from operating properly.

Dimensions in Inches (Centimeters)			
	Model RMA	Model RMB	Model RMC

Inlet Piping Run: It is good practice to approach the flowmeter inlet with as few elbows and restrictions as possible. In every case, the inlet piping should be at least as large as the connection to the flowmeter; i.e., 1/8" Iron Pipe Size for RMA models 1/4" IPS for RMB models, 1/2" IPS for RMC models. Length of inlet piping makes little difference for normal pressure-fed flowmeters.

For flowmeters on vacuum air service, the inlet piping should be as short and open as possible. This will allow operation near atmospheric pressure and thereby insure the accuracy of the device. (**Note:** for vacuum air service, the flow control valve, if any, should be on the discharge side of the flowmeter. Either the TMV unit or a separate in-line valve may be applied.)

Discharge Piping: As on the inlet, discharge piping should be at least as large as the flowmeter connection. Also, for pressure-fed flowmeters on air or gas service, the discharge piping should be as short and open as possible. This will allow operation of the flow tube at near atmospheric pressure and insure the accuracy of the device. This is of less importance on water or liquid flowmeters, as the flowing medium is generally incompressible and moderate back pressure will not affect the accuracy of the instrument as calibrated.

POSITIONING AND MOUNTING

All Rate-Master® Flowmeters must be mounted in a vertical position with inlet connection at the bottom rear and outlet at the top rear.

Bezel or Through-Panel Mounting: Make panel cutout using appropriate dimensions from Fig. 2. Flowmeter must fit into panel freely without forcing or squeezing. Insert the flowmeter from the front of the panel and install the mounting clamps from the rear. Insert and tighten the clamp bolts in the locations shown in Fig. 3. Do not exceed 5 in./lbs. Make connections to inlet and outlet ports using small amount of RTV sealant or Teflon® thread tape to avoid leakage. Avoid excess torque, which may damage the flowmeter body.

Surface Mounting: Drill appropriate holes in panel, using the dimensions shown in Fig. 2. Hold the flowmeter in position in front of the panel and install the clamp bolts from the rear. (The mounting clamps may be used as washers, if desired, by installing them backwards or straightening them out.) Pipe up inlet and discharge following the directions in the previous sections.

Surface Mounting on Piping Only: An alternate method of surface mounting, omitting the clamp bolts and supporting the flowmeter solely on the connecting piping, is possible. For this method, extra-long or straight pipe threads should be used so that nuts may be run onto the pipe and later tightened against the back of the panel to retain the unit in proper position. Use appropriate hole layout in formation from Fig. 2, but omit the small holes.

Surface Mounting on Piping Only Without Panel: For a temporary or laboratory type installation, the panel may be omitted altogether and the flowmeter installed directly in rigid piping. Its light weight permits this without difficulty.

OPERATION

To start system, open valve slowly to avoid possible damage. Control valves on BV and SSV models are turned clockwise to reduce flow, counter-clockwise to increase flow. A nylon insert is provided in the threaded section of the valve stem to give a firm touch to valve and to prevent change of setting due to vibration.

The performance of low range units used in air or gas applications may be affected by static electricity. Excessive static charge may cause the ball float to behave erratically or provide a false reading. To ensure the proper function of the unit, the application should be designed to minimize or dispel static electricity.

The standard technique for reading a Variable Area Flowmeter is to locate the highest point of greatest diameter on the float, and then align that with the theoretical center of the scale graduation. In the event that the float is not aligned with a grad, an extrapolation of the float location must be made by the operator as to its location between the two closest grads. The following are some sample floats shown with reference to the proper location to read the float.

Variable Area Flowmeters used for gases are typically labeled with the prefix "S" or "N", which represents "Standard" for English units or "Normal" for metric units. Use of this prefix designates that the flowmeter is calibrated to operate at a specific set of conditions, and deviation from those standard conditions will require correction for the calibration to be valid. In practice, the reading taken from the flowmeter scale must be corrected back to standard conditions to be used with the scale units. The correct location to measure the actual pressure and temperature is at the exit of the flowmeter, except when using the Top Mounted Valve under vacuum applications, where they should be measured at the flowmeter inlet. The equation to correct for nonstandard operating conditions is as follows:

$$Q_2 = Q_1 \times \sqrt{\frac{P_1 \times T_2}{P_2 \times T_1}}$$

Where: Q_1 = Actual or Observed Flowmeter Reading
 Q_2 = Standard Flow Corrected for Pressure and Temperature

P_1 = Actual Pressure (14.7 psia + Gage Pressure)
 P_2 = Standard Pressure (14.7 psia, which is 0 psig)
 T_1 = Actual Temperature (460 R + Temp °F)
 T_2 = Standard Temperature (530 R, which is 70°F)

Example: A flowmeter with a scale of 10-100 SCFH Air. The float is sitting at the 60 grad on the flowmeter scale. Actual Pressure is measured at the exit of the meter as 5 psig. Actual Temperature is measured at the exit of the meter as 85°F.

$$Q_2 = 60.0 \times \sqrt{\frac{(14.7 + 5) \times 530}{14.7 \times (460 + 85)}}$$

$Q_2 = 68.5$ SCFH Air

CAUTION: Do not completely unscrew valve stem unless the flowmeter is unpressurized and drained of any liquid. Removal while in service will allow gas or liquid to flow out the front of the valve body and could result in serious personal injury. For applications involving high pressure and/or toxic gases or fluids, special non-removable valves are available on special order. Please contact factory for details.

MAINTENANCE

The only maintenance normally required is occasional cleaning to assure reliable operation and good float visibility.

Disassembly: The flowmeter can be disassembled for cleaning simply as follows:

1. Remove valve knob from RMB or RMC -BV or -SSV units by pulling the knob forward. It is retained by spring pressure on the stem half-shaft so that a gentle pull will remove it. On RMA-BV or -SSV models, turn the valve knob counter-clockwise until the threads are disengaged. Then withdraw the stem from the valve by gently pulling on the knob.
2. Remove the four mounting bracket screws located in the sides of the flowmeter. See Fig. 3. Pull the flowmeter body gently forward away from the back plate to avoid undue strain on the body. Leave the piping connections intact. There is no need to disturb them. See Fig. 4.
3. Threaded body style flowmeters - Remove the slip cap with a push on a screwdriver as shown in Fig. 5. Remove the plug ball stop as shown in Fig. 6 using allen wrench sizes as follows: Model RMA - 1/4", Model RMB - 1/2" and Model RMC - 3/4" Threadless body style flowmeters - Release the plastic retaining clip with a screw driver (Figure 5B), it will unclip from the valve body (TMV Option) or the plug ball stop, slide the clip back until the valve body or ball stop can be removed. The clip will remain in the body for convenience. Using a screwdriver gently lift up on the plug in the groove as shown in Figure 6B until the o-ring seal is released and remove the plug. For the TMV option gently pull up on the valve knob to release the valve body seals and remove the valve.
4. Take out the ball or float by inverting the body and allowing the float to fall into your hand, as shown in Fig. 7. (Note: It is best to cover the discharge port to avoid losing the float through that opening.)

Cleaning: The flow tube and flowmeter body can best be cleaned with a little pure soap and water. Use of a bottle brush or other soft brush will aid the cleaning. Avoid benzene, acetone, carbon tetrachloride, alkaline detergents, caustic soda, liquid soaps (which may contain chlorinated solvents), etc. Also, avoid prolonged immersion, which may harm or loosen the scale.

Reassembly: Simply reverse steps 1 through 4 and place the flowmeter back in service. A little stopcock grease or petroleum jelly on the "O" rings will help maintain a good seal as well as facilitate assembly. No other special care is required.

Proper Protein Fractionator Adjustment

A protein skimmer (actually a protein fractionator) is not a 'plug and play' piece of equipment. It requires close attention to achieve proper adjustment. This proper adjustment is critical to achieving the maximum performance from the unit.

The fractionator is adjusted by creating back pressure at the discharge by throttling the discharge valve. The gas intake and water inlet need to be set to their recommended flow rates. Throttling back the discharge valve increases the back pressure and raises the foam level in the upper chamber. This is basically a hydraulic balancing procedure. (Do not throttle water or air flow to and from the venturis to control foam height. Venturi water valves should run in the open position. Venturi air intakes should be adjusted to a 1" to 2" vacuum.)

The fractionator needs to be adjusted to a level that consistently produces an effluent the color of weak tea or ginger ale. Lowering the foam level to the point where it only produces dry foam and a dark effluent inhibits the removal of waste products. A new installation that has not had any fractionation for more than a few days will require 2 to 7 days for the system to achieve a level of stable organic removal.

Protein fractionators remove compounds from the water by injecting fine bubbles into the water. Organic compounds 'stick' to the surface tension of the water which includes the surface of the bubbles. As the organic laden foam rises into the upper chamber it overflows into the collection area.

The discharge valve adjustment combined with the Bio-load (and certain additives) will affect the foam level. If the foam level is set too low the protein fractionator will only remove a small amount of waste even from very dirty water. Waste levels which are below this threshold remain in the water since the protein fractionator is not adjusted to remove them. The result of this level of adjustment is a very dark, concentrated waste extract from the protein fractionator. When this is occurring the aquarist has no way of determining how efficient the protein fractionator is working other than by observing the color of the water in the aquarium.

Adjusting the level too high creates a situation where the fractionator is removing a large amount of water that has very little dissolved organics.

To properly adjust a protein fractionator takes at least several days of observation and adjustments. You should allow a minimum of a half an hour between adjustments to allow the hydraulics to settle into balance. There are a couple things to remember to achieve proper adjustment. The first is the protein fractionator only removes waste to the threshold you have set. As it approaches this threshold it removes less and less resulting in a concentrated extract. The other is that the extract should be roughly the color of ginger ale or weak tea. If it is darker, the threshold is set too low.

To adjust the fractionator properly the following must be done:

1. Make sure the venturi and inlet flows are set to the recommended rates.
2. Adjust the protein fractionator by throttling the discharge valve so that the extract is about the color of ginger ale or weak tea. Ideally you will produce a sudsy foam that is between the consistency of water and shaving cream.
3. Let it run, even though it may run wet for a while. As it approaches the new threshold level for waste extraction it will begin to slow down and the extract will become darker and more concentrated. When this happens repeat step 1 and step 2.
3. When the point is reached that the protein fractionator does not slow down after a few days then it can be assumed that the protein skimmer is properly adjusted. In the case of very dirty water this process may take quite a number of adjustments and may take longer to slow down the first time. Keep the protein fractionator adjusted so that the extract does not become dark.

Adding feed, organic matter or animals to the water will cause the foam level to rise, sometimes substantially. Certain oils and other compounds will inhibit foam production. If the skimmer level “bounces” or changes radically over a short period, there may be hydraulic issues with the way the filter is plumbed and/or vented.

NEVER BLOCK THE DISCHARGE VENT UNION AT THE TOP OF THE FRACTIONATOR. This will pressurize the unit, and void all warranties. If you connect any filters or ozone destruct equipment to the top vent, the vent must remain free-flowing or at a slightly negative pressure.

To maintain an efficient fractionator the upper chamber must remain clean and the rinse system in the upper chamber needs to be working properly. The chamber should be accessed through the top cover and cleaned manually every 90 days or if the rinse system has been out of operation for more than 3 hours. With a properly adjusted protein fractionator the water will be noticeably cleaner. Ideally aquarium water should be clear and colorless. The closer to this goal the better.

PRODUCT WARRANTY TERMS

RK2 Systems, Inc. (The Seller) warrants to the original purchaser, that products of its own manufacture will be free from defects in materials or workmanship, under normal use and service, for a period of one year from the date of purchase (with the exception of a vessel, which is warranted for three years). The Seller's obligations under this Warranty are limited to replacing or repairing or giving credit for, at its option, any of its said products which shall, within one year after purchase, be returned to the Seller's place of origin, transportation charges prepaid, and which are, after products examined, disclosed to the Seller's satisfaction to be thus defective. This Warranty does not apply to defects caused by shipping damages, or to any products manufactured by Seller which have been subject to improper installation, misuse, neglect, accident, ordinary wear and tear, or Buyer's attempts to use any products beyond its mechanical, thermal, or electrical capacity. Notice of a defective product must be given to Seller in writing within 48 hours of discovery and be free, without limitation of labor charges, lost profits, expenses of repair or other costs incidental to replacement. All transportation costs incurred in shipping product to or from Seller's plant shall be at the Buyer's expense. The aforementioned provisions do not extend the original Warranty period of any product which has either been partially repaired or replaced by the Seller.
